INTERVAL RECORDING

Name: ..... **Date:** .....

For behavior that is hard to count one by one, such as calling out or leaving the seat. Split the activity into equal intervals and mark an interval if the behavior happened at any point in it.

Behavior: _____ **Interval length (min):** _____

DATE	ACTIVITY	1	2	3	4	5	6	7	8	9	10	11	12	PERCENT marked / 12
.....	.....													
.....	.....													
.....	.....													
.....	.....													
.....	.....													
.....	.....													
.....	.....													
.....	.....													
.....	.....													

How to work out the percent. Count the intervals you marked, divide by twelve and multiply by a hundred: five marked intervals out of twelve is 42 percent. Compare like with like, so keep the same activity, the same interval length and the same number of intervals every session.

Which method to use. Mark the interval if the behavior happened at **any** point in it (partial interval) when you want to know how widespread the behavior is; it tends to overestimate. Mark only if it lasted the **whole** interval when you want to know how dominant it is; that tends to underestimate. Decide which one you are using before the first session and write it at the top of the page.
