From Seed to Plant

143 words

Every plant you see started as a seed. A seed is small, but it holds everything a new plant needs to begin. Inside the hard coat is a tiny plant and a store of food. When a seed lands in soil that is warm and wet, it begins to change. The coat softens and splits. A root pushes down into the soil to hold the plant in place and drink water. Then a shoot pushes up toward the light. At first the shoot is pale. When it reaches the sun, it turns green and grows leaves. The leaves make food for the plant from sunlight, water and air. The plant grows taller and, in time, it makes flowers. The flowers make new seeds. Some seeds fall to the ground. Others are carried away by wind, water or animals. Then the cycle starts again.

1. What does a seed need to begin growing?

snow and ice | warm, wet soil | only sunlight

2. Which part of the plant grows first?

the flower | the root | the leaves

3. Why does the shoot turn green only when it reaches the sun? THINK

it needs sunlight to make food | it is afraid of the dark | the rain paints it

4. In this text, a "cycle" is WORD

a bicycle | something that repeats in a circle | a kind of seed

5. Name two ways seeds travel to new places.
