What would you do?

Name: _____ **Date:** _____

INSTRUCTIONS:

Read each situation. Write what you would do, in order, including who you would tell.

1. A few drops of dilute acid splash onto the back of your hand.

2. Your partner's sleeve catches the edge of the Bunsen flame and starts to smoulder.

3. A beaker slips out of your hand and shatters on the floor.

4. There is a bottle of clear liquid on your bench with no label.

5. Some liquid splashes into your eye.

6. The method says to heat a liquid in a test tube over a Bunsen burner.

7. You notice a strong smell in the lab and start to feel dizzy.

8. You have finished and there is leftover copper sulfate solution in your beaker.

ANSWER KEY:

What would you do? (model answers, one numbered paragraph each)

1. Rinse the hand under cold running water for several minutes and tell the teacher. Do not wipe it with a cloth or paper towel.

2. Shout for the teacher at once. Move your partner away from the flame and smother the sleeve with the fire blanket; if clothing is burning, stop, drop and roll. Never run.

3. Warn the people around you, step back and tell the teacher. Sweep the pieces up with a dustpan and brush, never your fingers, into the broken-glass bin.

4. Do not use it, smell it or pour it away. Tell the teacher so it can be identified and disposed of safely.

5. Go straight to the eyewash station, hold the eye open and rinse for at least 15 minutes while someone fetches the teacher. Do not rub the eye.

6. Wear goggles, hold the tube in a test-tube holder, point it away from everyone, and heat gently by moving it in and out of the flame so the liquid does not spit.

7. Move away from the source, tell the teacher immediately and open windows or switch on the fume cupboard. Leave the room if the teacher says so.

8. Ask where it should go and pour it into the labelled waste container, never down the sink or back into the stock bottle. Wash the beaker and your hands.
