EQUIVALENT FRACTION CIRCLES

Name: ..... Date: .....

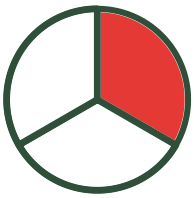

The two circles in each row have the same amount of red, but are cut into a different number of pieces. Count the pieces and fill in the missing number so both fractions name the same amount.

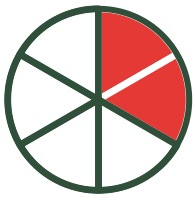

$\frac{1}{2} = \frac{\square}{4}$

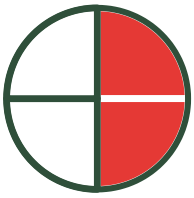

Count the pieces in the second circle, then count its red pieces.

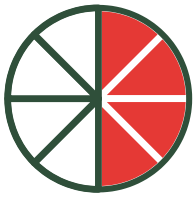

$\frac{1}{3} = \frac{2}{\square}$

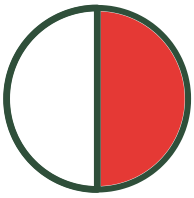

Count the pieces in the second circle, then count its red pieces.

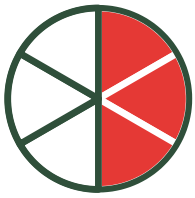

$\frac{2}{4} = \frac{\square}{8}$

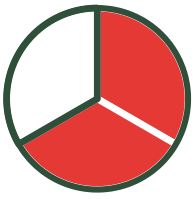

Count the pieces in the second circle, then count its red pieces.

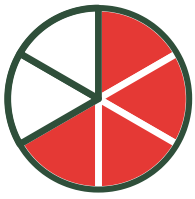

$\frac{1}{2} = \frac{\square}{6}$

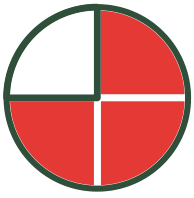

Count the pieces in the second circle, then count its red pieces.

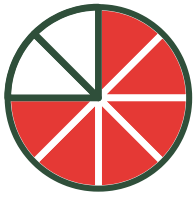

$\frac{2}{3} = \frac{4}{\square}$

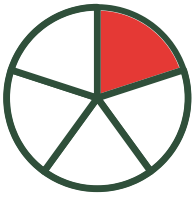

Count the pieces in the second circle, then count its red pieces.

$\frac{3}{4} = \frac{\square}{8}$

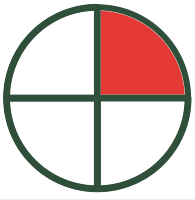

Count the pieces in the second circle, then count its red pieces.

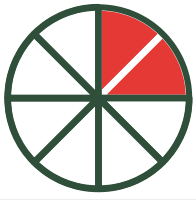

$\frac{1}{5} = \frac{2}{\square}$

Count the pieces in the second circle, then count its red pieces.

$\frac{1}{4} = \frac{\square}{8}$

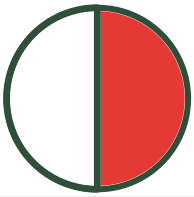

Count the pieces in the second circle, then count its red pieces.

EQUIVALENT FRACTION CIRCLES

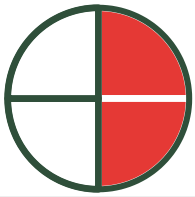

ANSWER KEY

Name: _____ Date: _____

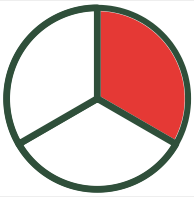

The two circles in each row have the same amount of red, but are cut into a different number of pieces. Count the pieces and fill in the missing number so both fractions name the same amount.

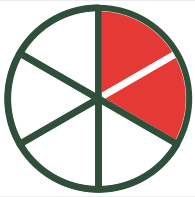

$\frac{1}{2} = \frac{2}{4}$

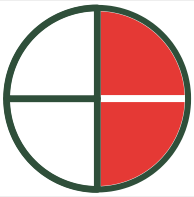

1/2 is the same amount of red as 2/4

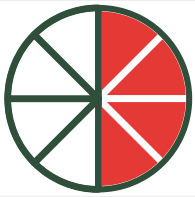

$\frac{1}{3} = \frac{2}{6}$

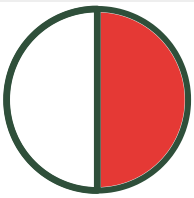

1/3 is the same amount of red as 2/6

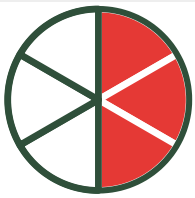

$\frac{2}{4} = \frac{4}{8}$

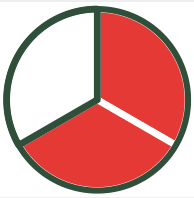

2/4 is the same amount of red as 4/8

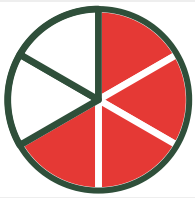

$\frac{1}{2} = \frac{3}{6}$

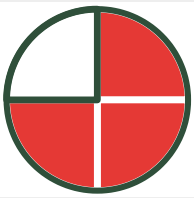

1/2 is the same amount of red as 3/6

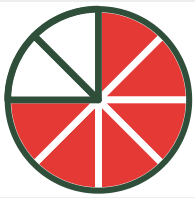

$\frac{2}{3} = \frac{4}{6}$

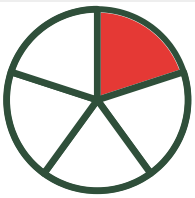

2/3 is the same amount of red as 4/6

$\frac{3}{4} = \frac{6}{8}$

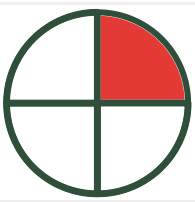

3/4 is the same amount of red as 6/8

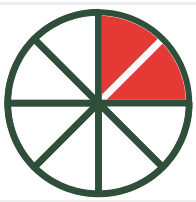

$\frac{1}{5} = \frac{2}{10}$

1/5 is the same amount of red as 2/10

$\frac{1}{4} = \frac{2}{8}$

1/4 is the same amount of red as 2/8
